

Commtech Wireless Public Safety Solutions

Integrate. Automate. Communicate.

Real-Time Communications and Connectivity When Every Second Counts

- » Expand the Reach of Emergency Communications
- » Enable First Responders to React More Quickly
- » Create More Efficient Workflow for Dispatch Operators
- » Reduce Alarm Distribution Time from minutes to Seconds
- » Leverage Existing Computer Aided Dispatch (CAD System)

Commtech Solutions for Public Safety

Commtech has provided mission-critical communication solutions for many public safety organizations across the USA. The Fusion Series Event Management Module (EMM), a self-contained network appliance (no PC/Server needed), provides off-the-shelf data integration for all CAD systems. Commtech Messenger, a powerful and versatile paging terminal for enterprise notification and messaging, delivers real-time messaging to all on-site paging systems, wide-area paging and cell phone networks. Commtech also offers a broad portfolio of paging transmitters and highly durable and reliable pagers for deploying large private paging networks. Virtually instantaneous message delivery is provided with no monthly recurring network service charges, and a ROI of the system is typically obtained in less than 24 months.

Mission-Critical Communications

When split seconds can impact life threatening situations, there is no margin for error and every moment counts. Public Safety organizations rely on their communication technologies to deliver critical information to first responders in order to react quickly and effectively to emergency scenarios. Police, Fire and EMS agencies as well as dispatch operators need to be armed with the best possible communications tools to do so. Commtech Wireless is uniquely positioned to leverage existing communication systems to enhance the effectiveness of distributing real-time information, and can also offer a comprehensive end-to-end solution in deploying private paging networks and pagers.

Systems Interoperability

All commercially available Computer Aided Dispatch (CAD) systems can be seamlessly integrated to deliver descriptive alarm conditions to First Responder recipients and groups. This communication flow is transparent to the dispatch operator as specific triggers in the integrated data result in immediate distribution to the communication devices used by responders in the field. Compatibility is provided "off-the-shelf" with all major wireless carriers and device types (cell phones, 1&2 way pagers, PDAs, and pocket PCs) via the latest Internet-based messaging protocols, as well as modem dial-out.
